

Atari 8

Web Config

Your FujiNet makes available a sophisticated web-based configuration interface when you visit your device's IP address while it's powered on.

To find the IP address, use the [C] "Show Config" option, available in the main screen of the CONFIG program. Note the IP address of the FujiNet. Browse to that address with a browser on the same network.

Using this you can configure:

- Explore TNFS hosts
- Mount and umount disk images
- Virtual Printing (model to emulate)
 - Virtual Modem
 - HSIO - high speed SIO settings
- Time and Time Zone info
- UDP streaming
- Virtual cassette
- CP/M emulation
- PC-Link
- Swapping disk slots
- Boot settings - for SpartaDos and others

The screenshot shows the FujiNet web interface with several tabs at the top: NET • WORK, HARD • WAVE, MODEM • SETTINGS, PRINTERS • SETTINGS, and FLOPPY • SETTINGS. The main content area displays configuration options for each tab, such as network settings, disk mounting, printer emulation, and floppy disk management.

Atari 8

Welcome to Your New FujiNet

*The FujiNet is for use in all
Atari 8bit systems with at least
32k ram*

- Your Atari only boots from disk drive #1

- If you hold the [Select] key on the Atari as it boots, FujiNet won't automatically connect to the last configured WiFi, and allow you to immediately configure a new network

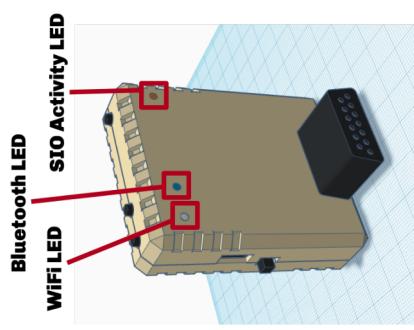

- The FujiNet uses USB-C for flashing updates and monitoring debug messages. A USB-C cable is not included.

- A SD card is included and is already formatted and ready for use in the FujiNet.
- Your FujiNet is already flashed with recent Firmware.
- The FujiNet will obtain power from the SIO port and power itself when the Atari is turned on

- B button - disk swap/toggle bluetooth
- B button - debug safe reset
- Reset button - reset FujiNet
- A button - print swap
- B button - toggle BT
- USB-C Port Flash/Debug
- Switch power for the FujiNet

The FujiNet device has three LEDs:

- White for wifi connectivity
- Blue for BT connectivity
- Orange for SIO access

Version 1.0 | March 2024 The One Sheet Startup Guide for FujiNet

Startup Up

The first time you boot Fujinet CONFIG it will prompt you to connect to WiFi. You select your WiFi network and enter the password. This information is saved internally for subsequent boots.

Hold [SELECT] Key on the Atari when booting to bypass saved WiFi config and force it to scan for all available networks.

About Fujinet

Fujinet is powered by the Espressif ESP32 chipset, which works on 2.4GHz WiFi networks **only**. If you are using a "mixed" 2.4GHz/5GHz WiFi network (using both radio bands with the same SSID), it should work fine. Having a strong signal is critical for consistent loading times.

CONFIG was designed to be intuitive and helpful. On the main CONFIG screen you will see host slots on top and disk slots on bottom. You can jump between the host slots and disk slots with TAB. Selecting a host slot [RETURN] will begin the process of selecting and mounting a disk image from the host to an emulated disk drive.

Hosts can be an IP address or hostname of a TNS server (eg. `apps.irata.onLine`, `fujinet.diller.org`, `tnfs.fujinet.onLine`). The first host is named SD which points to the inserted SD card. With a host entry selected, press [E] to edit it.

```
HOST LIST
1 SD tnfs.fujinet.online
2 tnfs.fujinet.online
3 apps.irata.onLine
4 fujinet.atari8bit.net
5 EMPTY

```

Commands:

`1-8 Slot E Edit RETURN Browse Lobby`

`6 onfig Hs Drive Slots OPTION Boot`

`1-8 - Drive Slot`

`E - Edit a Host's Name`

`RETURN - browse files on Host`

`Config - go to config screen`

`TAB - jump between Hosts and Drives`

`Lobby - launch Lobby app`

`OPTION - boot from Drive 1`

Hosts

Hosts are remote locations that contain disk images that the Fujinet can mount as a disk drive. They can be remote or local. IP addresses or DNS names can be used.
